consecution Documentation

Release 0.2.0

Rob deCarvalho

Feb 24, 2021

Contents

Consecution is:

- An easy-to-use pipeline abstraction inspired by Apache Storm Topologies.

- Designed to simplify building ETL pipelines that are robust and easy to test

- A system for wiring together simple processing nodes to form a DAG, which is fed with a python iterable

- Built using synchronous, single-threaded execution strategies designed to run efficiently on a single core

- Implemented in pure-python with optional requirements that are needed only for graph visualization

- Written with 100% test coverage

See the Github project page. for examples of how to use *consecution*.
